### Mathematics Enhancement Programme

**Y8**  
**UNIT 14** *Straight Line Graphs*  
**Lesson Plan 1**

<table>
<thead>
<tr>
<th>Activity</th>
<th>Notes</th>
</tr>
</thead>
</table>
| **1** Revising the use of grids  
T: Can you remember how to plot and read points on a grid? We'll be working on grids in this unit, so we'll start by revising them.  
**OS 14.1 with the following points added in:**  
I (–4, 0)  
J (2, 0)  
K (0, 3)  
L (0, –5)  
**1A Using grids**  
*First column:*  
A (4, 7),  
C (5, –3),  
E (–5, –3),  
G (4, –7),  
I (–4, 0),  
K (0, 3)  
**1B Individual practice**  
*Second column:*  
B (6, 2),  
D (–5, 6),  
F (–6, –7),  
H (–3, 8),  
J (2, 0),  
L (0, –5)  
**2 Revision - plotting points**  
T: Now we'll do the process inversely. We have the coordinates; now we have to plot the points.  
**OS 14.2**  
Whole class activity. Task appears on OHP.  
T points to Ps to read the coordinates of the points on the grid and then to write them on OS.  
Each point is read by a different P. The first few Ps are also asked to explain how to read the coordinates, stressing the importance of the order in which the coordinates are given. Slower Ps are then asked to read points. If many find this difficult, T can plot further points (including points on the axes) for them to practise. Agreement. Praising.  
Individual work.  
T monitors Ps' work, if necessary giving a copy of OS 14.1 to any struggling Ps and helping them to read the coordinates by pointing to the points with their fingers/pens.  
Verbal checking. Agreement, feedback, self-correction. Praising.  
Whole class activity. Task appears on OHP.  
Mainly slower Ps are asked to plot points on OS.  
Ps watch and may help.  
Each P is given a copy of OS 14.2 and, after agreement, plots the correct points on it.  
Praising, joining the points in order, including the first to the last one, and naming the shape (heptagon).  
© CIMT, University of Exeter
Activity

3A Plotting points from coordinates
PB 14.1, Q5 (−1, −5)

3B Individual practice - plotting points from coordinates
For slower Ps: PB 14.1, Q4 (−1, −3)
For stronger Ps: PB 14.1, Q4 changed, giving only two corners:
(3, 1) and (−1, 1)

T: Some of you were given only two points: (3, 1) and (−1, 1). Have you all found the square shown on the OHP? (Yes)
T: Could you complete it in another way? (3, 5); (−1, 5)
T: Is that the only alternative? Imagine that the two corners are placed diagonally ... Who can show it on the OHP? ... Did anyone have this solution? ...Please give us the coordinates. (1, 3); (1, −1)

27 mins

4 Function machines
T: Pairs of numbers can also be given from function machines.
T: Let's use a number machine that multiplies the number that you put into it by 5.

What will you get if you put in:

<table>
<thead>
<tr>
<th>T:</th>
<th>Ps:</th>
</tr>
</thead>
<tbody>
<tr>
<td>3</td>
<td>15</td>
</tr>
<tr>
<td>10</td>
<td>50</td>
</tr>
<tr>
<td>100</td>
<td>500</td>
</tr>
<tr>
<td>1</td>
<td>5</td>
</tr>
<tr>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>4</td>
<td>20</td>
</tr>
<tr>
<td>−4</td>
<td>−20</td>
</tr>
<tr>
<td>−1.5</td>
<td>−7.5</td>
</tr>
</tbody>
</table>

(continued)
T: Another machine divides the number put into it by – 2. Can you say what pairs of numbers it will produce?

<table>
<thead>
<tr>
<th>T: 4</th>
<th>Ps: –2</th>
</tr>
</thead>
<tbody>
<tr>
<td>6</td>
<td>–3</td>
</tr>
<tr>
<td>20</td>
<td>–10</td>
</tr>
<tr>
<td>–2</td>
<td>1</td>
</tr>
<tr>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>–100</td>
<td>50</td>
</tr>
<tr>
<td>1</td>
<td>–0.5</td>
</tr>
<tr>
<td>–3</td>
<td>1.5</td>
</tr>
</tbody>
</table>

33 mins

5 Individual work - completing grids for pairs of numbers

T: We can also illustrate the pairs of numbers produced by a number machine on a grid. Let's look at two examples.

(A) T: The first number machine multiplies the number put in by 2. Copy and complete the table on the BB.

<table>
<thead>
<tr>
<th>x</th>
<th>–2</th>
<th>–1</th>
<th>0</th>
<th>1</th>
<th>2</th>
<th>3</th>
</tr>
</thead>
<tbody>
<tr>
<td>2x</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Solution: –4 –2 0 2 4 6

T: So we have some pairs of numbers: (–2, –4); (–1, –2); (0, 0), etc. Let's use them as coordinates and put them on a grid.

T: How do these points seem to be relating to each other on the grid? (They seem to be on a straight line)

T: Do all number machines produce points that are on the same straight line? ... Let's look at another one.

(B) T: This number machine squares the number put into it.

<table>
<thead>
<tr>
<th>x</th>
<th>0</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
</tr>
</thead>
<tbody>
<tr>
<td>x²</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Solution: 0 1 4 9 16

45 mins

Set homework

(1) PB 14.1, Q3

PB 14.1, Q9

(2) Copy and complete the table, then, on a grid, plot the points given by the pairs of numbers. What do you notice?

<table>
<thead>
<tr>
<th>x</th>
<th>–3</th>
<th>–2</th>
<th>–1</th>
<th>0</th>
<th>1</th>
<th>2</th>
<th>3</th>
</tr>
</thead>
<tbody>
<tr>
<td>3x</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Individual work, monitored, and helped if necessary.

Then T prepares a grid on BB (Ps in Ex.Bs) or shows a prepared OS, and asks Ps to come and plot the points at BB/OHP. Agreement, praising; all Ps plot the points on their grids.

Whole class activity.

T may quickly remind Ps about 'squaring' (i.e. \( x^2 = x \times x \)), then asks, agrees, praises and writes correct answers in the table (Ps in Ex.Bs).

Then the points are plotted on BB and in Ex.Bs as before and a short discussion takes place: these points do not seem to be on a straight line.
Activity 1

Checking homework

(1) PB 14.1, Q3 (a), (b)

(2) Completing the table and plotting the points

<table>
<thead>
<tr>
<th>x</th>
<th>-3</th>
<th>-2</th>
<th>-1</th>
<th>0</th>
<th>1</th>
<th>2</th>
<th>3</th>
</tr>
</thead>
<tbody>
<tr>
<td>3x</td>
<td>-9</td>
<td>-6</td>
<td>-3</td>
<td>0</td>
<td>3</td>
<td>6</td>
<td>9</td>
</tr>
</tbody>
</table>

Number machines for remainders

T: So the points of the rule $x \rightarrow 3x$ are again all on a straight line. Why are the points in the second table at the end of the last lesson not in a straight line?

Let's look at another type of equation, a number machine that gives remainders. You put in a whole number, the machine divides it by 2 and gives you the remainder.

Are all these points on a straight line?

<table>
<thead>
<tr>
<th>x</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
<th>6</th>
<th>7</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>1</td>
<td>0</td>
<td>1</td>
<td>0</td>
<td>1</td>
<td>0</td>
<td>1</td>
</tr>
</tbody>
</table>

T: Can you predict whether these points will be on a straight line? *(They won't be on a straight line)*

T: Let's check.

Notes

T has asked two Ps to draw a grids showing the solutions of part (1) of homework on BB as soon as Ps arrive. Other Ps agree/correct.

Feedback, self-correction. Praising.

Then detailed discussion of task (2). T sketches table on BB, points to slower Ps to dictate the missing numbers, agrees, writes correct answers in the table.

Then T draws a grid on BB and points to slower Ps to plot the points on the grid.

Agreement or correction for each point. Feedback at end. Praising.

Agreement that these points are again all on a straight line (see previous lesson).
### Activity 3

**Plotting straight lines**

T: So now we need to answer the question:

"What type of rules will give points that are all on a straight line?"

So far we've used different rules and got different graphs, now we'll look at graphs of straight lines and then find their rules.

**OS 14.4**

T: What do you notice here?

(The points are all on a straight line)

T: Draw the line on your set of axes.

T: Look at the coordinates of the points.

Can you see a relationship between them?

(For each point, the y-coordinate is 4 times the x-coordinate)

T: Write it down.

P: \( y = 4x \)

T: So what is the rule that gives us these points?

Ps: \( x \rightarrow 4x \)

T: We were given only 5 points, but you've drawn a straight line on the grid. What's happened?

Ps: We got lots of points.

T: Do the coordinates of these points fit the same equation? ...

Let's read the point which has 0.5 as its x-coordinate.

P: (0.5, 2)

T: So?

Ps: 0.5 \( \times \) 4 = 2, so that's OK.

T: What is the x-coordinate of the point which has 10 as its y-coordinate?

Ps: About 2.5.

T: And?

Ps: And 2.5 \( \times \) 4 = 10.

T: Can we take it that all the points on this line fit this equation?

Ps: Yes

---

### 4A Finding the rule

T: Now I'll give you some points. Your task is to plot and draw them on your grid and then find the rule. You can use the grid from OS 14.4.

T (writes on BB): (0, 0), (1, 0.5), (2, 1), (4, 2)

P: The relationship I've found is \( x = 2y \).

T: And put another way? Can you change the subject of this formula?

P: \( y = \frac{1}{2}x \) or \( y = 0.5x \)

T: So what can we write as the rule?

P: \( x \rightarrow 0.5x \)
A question in context

T: Now we'll look at a problem in context. Listen to the problem, answer it and find the connection between the text and the straight line in the previous section.

On a market stall, 1 kg of bananas costs £0.50. Calculate the cost of

<table>
<thead>
<tr>
<th>T:</th>
<th>2 kg</th>
<th>Ps:</th>
<th>£1</th>
</tr>
</thead>
<tbody>
<tr>
<td>4 kg</td>
<td>£2</td>
<td></td>
<td></td>
</tr>
<tr>
<td>0 kg</td>
<td>£0</td>
<td></td>
<td></td>
</tr>
<tr>
<td>x kg</td>
<td>£(0.50 \times x)</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

T: What can we say about the answers?

(Each answer corresponds to a point on the graph of \(x \rightarrow 0.5x\))

T: Can you read from the graph the cost of 3 kg of bananas?

(3 kg \(\rightarrow\) £1.50)

Revision of linear proportion

T: What can you say about the relationship between the bananas and their cost?

(If the mass of bananas is doubled, the cost will be doubled)

T: What do we call this type of connection?

(We say they are in direct or linear proportion to each other)

T: Why are they 'linear'?

(Because their graph is in a straight line)

T: Is the inverse (opposite) true as well? Do all the straight lines correspond to a direct/linear proportion? We'll look at this now.

There is another graph on your grid. What can you say about the coordinates of these points? \(\rightarrow\) (1, 4), (2, 8), (3, 12), ...

(They are all in linear proportion (except the point (0, 0))

T: Turn back to your homework graph: (1, 3), (2, 6), (3, 9), ...

(These points are also in linear proportion)

T: Let's plot some of these points, e.g. (writes on BB): (0, 0), (1, 3), (2, 6), (3, 9) on this grid and draw the straight line and then compare the three graphs.

T: Is there any common property?

(They all pass through the point (0, 0), the origin of the graph)

T: Any differences?

(The steepness of the lines is different)

T: Write the rules of the graph next to each one. Which line is the steepest?

\(y = 4x\), then \(y = 3x\), finally \(y = 0.5x\), so the greater the number \(x\) is multiplied by, the steeper the graph

T: Good. We'll find out more about this in our next lesson.
**Activity 6**

**Individual work**
T: Let’s look at our final task for this lesson:

(a) Plot the points given in the table:

<table>
<thead>
<tr>
<th>x</th>
<th>–3</th>
<th>–2</th>
<th>–1</th>
<th>0</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
</tr>
</thead>
<tbody>
<tr>
<td>y</td>
<td>6</td>
<td>2</td>
<td>0</td>
<td>–2</td>
<td>–4</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

(b) Draw a straight line through the points.
(c) Give the rule of the graph.
(d) Fill in the missing coordinates by reading them from the graph and checking the rule.

---

**Set homework**
(1) Complete Activity 6 from the lesson.
(2) PB 14.2, Q4
(3) Use the same grid to draw straight lines between the following points and write down the rule of each graph:

(a) (–1, –2), (0, 0), (1, 2), (3, 6)

(b) (–3, –1), (0, 0), (1, 1/3), (6, 2)

(c) (–2, 6), (–1, 3), (1, –3), (3, –9)

---

**Notes**
Individual work, monitored, helped.
Task appears on OHP.
T give Ps 5 minutes, then stops the work, draws a grid on BB with the graph for Ps to check.
Feedback, self-correction.
Praising.
Then T asks for the relationship between the x and y coordinates (y = –2x), comparing it with the graphs in the previous examples (increasing-decreasing).
Part (d) can be given as homework.
Y8  UNIT 14  Straight Line Graphs  Lesson Plan 3

Activity

1  Checking homework (and further discussion)

1A  (1) Completing the final activity of the last lesson

The missing coordinates:

\((-2, 4) \times (-2) = 4\)

\((3, -6) \times 3 = -6\)

\((4, -8) \times (-2) = -8\)

so the rule is \(y = -2x\).

1B  (2) and (3) PB 14.2, Q4 and more about the graph

\((1, 1), (2, 2), (4, 4), (5, 5) \Rightarrow y = x\)

\((-1, -2), (0, 0), (1, 2), (3, 6) \Rightarrow y = 2x\)

\((-3, -1), (0, 0), (1, \frac{1}{3}), (6, 2) \Rightarrow y = \frac{1}{3}x\)

\((-2, 6), (-1, 3), (1, -3), (3, -9) \Rightarrow y = -3x\)

1C  Introducing 'gradient'

T: What do you notice when you look at all the graphs?

P: All four graphs are straight lines.

P: The all pass through the point (0, 0), the origin.

T: From now on we’ll refer to the rules as equations. Is there any similarity in their equations?

P: All the equations follow the pattern

\(y = \text{something} \times x\)

T: What is the 'something'?

P: For the first example the 'something' is 1, so \(y = 1 \times x\) can be written here.

T: What about the other lines?

Ps: 2, \(\frac{1}{3}\), -3 are the 'somethings'.

T: How are the graphs different?

Ps: In their steepness.

T: And what do we mean by steepness?

P: How fast the graph rises.

T: Do all of them rise?

Ps: All except \(y = -2x\).

T: Right. Let's look at the first three graphs and their equations. What else do they have in common? Try to give it as a statement.

P: If the multiplier in the equation is positive, the graph will rise/increase.

T: What is the difference in the rate of increase?

P: The larger multiplier gives a steeper rise.

T: Has anyone noticed how the multiplier in the equation changes the steepness?

P: When \(x\) increases by 1, the graph of \(y = 2x\) rises 2 units, while the graph of \(y = 1 \times x\) rises 1 unit.

T: And the graph of \(y = \frac{1}{3}x\)?
Activity

1C
(continued)

Ps: It rises by \( \frac{1}{3} \) unit.
T: Can you explain that - I'm not sure what you mean.
P: We can see that while \( x \) increases by 3, the graph rises 1 ...
T: That's right. The number, which multiplies \( x \) in the equation of the line and tells us the steepness of the rise of the line after one step in the direction of \( x \), is called the gradient. The gradient is used for measuring and describing the steepness of the line on the graph.
T: Let's see how we read it from the graph ...

Notes

The first figure from p41 of PB appears on OHP; a short discussion about gradient comes next.

2

Reading gradients

OS 14.5

T: Let's look at question (b) first.
P: The line rises 4 units over 2 steps, so

\[
\text{gradient} = \frac{4}{2} = \frac{2}{1} = 2
\]

T: What is the other way we can read this?
P: We can read the gradient from a smaller triangle as well: 1 step, 2 rises, gives the same gradient.
T: Now, for question (a), use any appropriate triangle to determine the gradient.
P: \( \frac{1}{1} = 1 \)
P: \( \frac{2}{2} = 1 \)
P: \( \frac{3}{3} = 1 \)

etc. with (c) and (d).
T: We haven't yet looked at the fourth graph from the homework.
Have a look at it now - how is it different from the previous ones?
P: It decreases. The decrease is 3 over 1 step.
T: So what is its rise?
P: ? ... \((-3)\) ?
T: Look at its equation.
P: \( y = -3x \)
T: So, is it likely that \((-3)\) is the gradient?
P: Yes.
T: OK. Now on to the last question on the OS. Who can explain it?
P: This is also a graph which decreases, so its gradient will be negative. Over 3 steps the rise is \(-4\), so the gradient is \(-\frac{4}{3}\).

Notes

Whole class activity.
Task appears on OHP.
T asks, volunteer Ps answer first, then T encourages slower ones. T agrees, praises, writes correct answers on OS.

T asks Ps to turn back to the fourth homework graph and then they calculate the negative gradients together.

23 mins

23 mins
### Y8

#### UNIT 14 **Straight Line Graphs** Lesson Plan 3

<table>
<thead>
<tr>
<th>Activity</th>
<th>Individual practice</th>
</tr>
</thead>
</table>
| 3        | PB 14.3, Q2 (a) 4,  (b) 1,  (e) $\frac{1}{2}$  
PB 14.3, Q3 (a) – 1,  (d) – 2 |

#### Gradient

**Notes**

### 4

**Plotting points and drawing straight line graphs**

T: All the straight lines we've seen so far have been drawn through the origin (the point (0, 0)). What type of rule/equation describes them?

Ps: $y = \text{something} \times x$.

T: What is the 'something'?

Ps: A number showing the gradient or steepness of the line.

T: So would you be able to give the equation of a straight line drawn through the origin if you were asked to?

Ps: Yes.

T: How would you do this?

Ps: By finding the gradient of the line.

T: Good. We'll use the letter '$m$' to represent the gradient, so the equation of these lines will be written as ... (writes on BB)

$$ymx = \times$$

(a)

T: Draw a grid in your Ex.Bs and then I'll give you a line. The point which defines the line is (2, 6). Plot the point and draw the straight line fitted on it.

Ps: ?

T: What's the problem? ... OK, I'll give you one more point ... Will this be enough, or should I give you more points? Why?

Ps: Two points uniquely define a straight line.

T: So now you can draw your line on BB.

T: Is this similar to what we've dealt with so far?

Ps: Yes.

T: Why?

Ps: It has passed through the point (0, 0), the origin.

T: So what is its equation?

Ps: $y = m \times x$

T: What does '$m$' represent?

Ps: The gradient of the line.

T: Who'd like to determine the equation at BB?

P (counts at BB): Between the two points we have been given, step = 3,  rise = 9  
so the gradient is $\frac{9}{3} = 3$.

The equation of this straight line is $y = 3x$.

(continued)

Ps write in Ex.Bs.

Each P draws a grid in Ex.B, T on BB.

T plots (2, 6) on the grid on BB, Ps in Ex.Bs.

Ps can protest.

T plots (– 1, – 3) on BB, Ps in Ex.Bs.

Volunteer draws the straight line on BB, others in Ex.Bs.

© CIMT, University of Exeter
### Activity 4 (continued)

T: How can we check this?

P: \((-1) \times 3 = -3 \text{ and } 2 \times 3 = 6\)

T: Good.

T: Now give the equation of the straight line drawn through these points ...

(b) \((-3, -2) \text{ and } (6, 4)\) \(y = \frac{2}{3}x\)

(c) \((-3, 12) \text{ and } (-1, 4)\) \(y = -4x\)

(d) \((-5, 1) \text{ and } (10, -2)\) \(y = -\frac{1}{5}x\)

---

**39 mins**  

**5** Individual practice drawing straight line graphs

T: I think it's time for you all to try some on your own.

Give the equation of the straight line fitted on the points:

(a) \((-1, -5) \text{ and } (2, 10)\) \(y = 5x\)

(b) \((-2, 1) \text{ and } (4, -2)\) \(y = -\frac{1}{2}x\)

(c) \((0, 0) \text{ and } (4, 6)\) \(y = \frac{3}{2}x\)

---

**45 mins**  

Set homework

(1) PB 14.3, Q2, (d), (f), (g), (h)  
PB 14.3, Q3 (b), (c)

(2) Give the equation of the straight line fitted on the points:

(a) \((-3, -6) \text{ and } (-1, -2)\)

(b) \((-1, 3) \text{ and } (3, -9)\)

(c) \((0, 0) \text{ and } (8, 6)\)

(d) \((4, -1) \text{ and } (12, -3)\)

<tr>
<td>T: So what does the graph of $y = 2x$ look like?</td>
<td></td>
</tr>
<tr>
<td>P: It passes through the origin and rises 2 units during 1 step.</td>
<td></td>
</tr>
<tr>
<td>T: What does the graph of $y = 3x$ look like?</td>
<td></td>
</tr>
<tr>
<td>... $y = -2x$ ...</td>
<td>... followed by Ps using their knowledge to draw a line (passing through the origin without actually finding any of the points. T draws a grid, asks, volunteer P comes out, draws the line (starts from (0, 0) and plots other points step by step) and explains.</td>
</tr>
<tr>
<td>... $y = \frac{1}{3}x$ ...</td>
<td></td>
</tr>
</tbody>
</table>

© CIMT, University of Exeter
What does the graph of \( y = \frac{3}{5}x \) look like?

... \( y = -\frac{3}{2}x \) ...

---

### Finding equations

T: Let's look again at number machines. Find the rule for the numbers in this table.

(A)

<table>
<thead>
<tr>
<th>( x )</th>
<th>-3</th>
<th>-1</th>
<th>0</th>
<th>1</th>
<th>4</th>
</tr>
</thead>
<tbody>
<tr>
<td>( y )</td>
<td>2</td>
<td>4</td>
<td>5</td>
<td>6</td>
<td>9</td>
</tr>
</tbody>
</table>

P: \( y = x + 5 \)

T: Is this rule similar to those we've met so far?

Ps: No!

T: What is the difference?

Ps: The +5.

T: Let's see what kind of points are given by this rule in a grid ...

T: Can you draw a straight line through the points? Do it ...

T: What can you say about this line?

P 1: It does not pass through the origin.

P 2: We can determine its gradient ... It is 1.

P 3: And this is also the multiplier of \( x \) in the rule for a straight line passing through \((0, 0)\).

(B)

T: Let's take another number machine and do the same as before:
find the rule of the pairs of numbers, plot them in a grid and then examine what we get.

<table>
<thead>
<tr>
<th>( x )</th>
<th>-2</th>
<th>0</th>
<th>1</th>
<th>2</th>
<th>4</th>
</tr>
</thead>
<tbody>
<tr>
<td>( y )</td>
<td>5</td>
<td>3</td>
<td>2</td>
<td>1</td>
<td>-1</td>
</tr>
</tbody>
</table>

P 1: \( x + y = 3 \)

(after plotting on BB):

P 2: We got a straight line again.

P 3: It doesn't pass through the point \((0, 0)\) either.

P 4: Its gradient is \(-1\).

T: Where can you see \(-1\) in its equation? Can you find \( y \) from it?
## Y8
### UNIT 14  *Straight Line Graphs*  
#### Lesson Plan 4

<table>
<thead>
<tr>
<th>Activity</th>
<th>Straight Lines</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>3</strong> (continued)</td>
<td><strong>Notes</strong></td>
</tr>
</tbody>
</table>

**P3:**  
\[ y = 3 - x \]  
**T:** Or we can write:  
\[ y = -x + 3 \text{ or } y = -1 \times x + 3. \]  
**P3:** And – 1 is the multiplier of x.  

24 mins

### Individual work

**PB 14.2, Q5 extended with the question:**  
**T:** Determine the gradient of the line.  
**P4:**  
**O:** For example, \( (0, 2), (4, 6), (6, 8) \)  
**P4:** The y-coordinate is always 2 more than the x-coordinate, i.e.  
\[ y = x + 2 \]  
**P4:** Gradient = 1

Properties:  
- equation \( y = x + 2 \) or \( y = 1 \times x + 2 \)  
- straight line  
- does not pass through the origin  
- gradient = 1  
- the gradient can be read from the equation of the line; it is the multiplier of x.  

32 mins

### Plotting points from an equation

**T:** Now we'll do something easier. Let's look at the inverse of the procedures we've just covered. I'll give you an equation and you have to find points to draw the line, then give the properties of the line.  

**OS 14.6**  
\[
\begin{array}{ccc}
  x & -2 & -1 \\
y & -5 & -2 \\
\end{array}
\]

**Properties:**  
- straight line  
- does not pass through the origin  
- gradient = \( \frac{3}{1} \)  
- the gradient is the multiplier of \( x \) in the equation.

37 mins

### Individual work

**PB 14.3, Q7 (also writing down properties, as before)**  

<table>
<thead>
<tr>
<th>( x )</th>
<th>2</th>
<th>0</th>
<th>2</th>
<th>3</th>
<th>4</th>
</tr>
</thead>
<tbody>
<tr>
<td>( y )</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Solution:**  
1 \( \frac{2}{3} \) \( \frac{3}{2} \) 4

**Properties:**  
- straight line  
- does not pass through the origin  
- gradient \( \frac{4}{8} = \frac{1}{2} \)  
- the gradient is the multiplier of \( x \) in the equation

43 mins

---

© CIMT, University of Exeter
### Activity 7

#### Summarising

T: What kind of lines have we dealt with today?
P₁: Straight lines, not passing through the origin (point (0, 0)).
T: What do the equations of these lines look like?
P₂: \( y = \text{something} \times x + \text{something} \)
T: What can you say about the first 'something'?
P₃: It is the gradient of the straight line.
T: So?
P₄: We can read the gradient of a line from its equation without drawing it.
T: In the same way as ... ?
P₅: In the same way as we could for straight lines passing through the origin.
T: For example, what is the gradient of the line of
   \( y = 5x + 3 \)?
P₆: Gradient = 5
T: \( y = \frac{1}{4}x + 2 \) ?
Ps (perhaps in chorus): \( \frac{1}{4} \)
T: Very good! But what is the other 'something' in the equations of these lines? We'll look at this in our next lesson.

---

### Set homework

PB 14.2, Q1, (and determine the gradient)
PB 14.3, Q8

---

### Notes

T makes Ps review what they have covered in this lesson. Quick questions/answers ...

---

**45 mins**
**Activity 1A**

**Checking homework**

PB 14.2, Q1 (a), (b)

(c) (2, 6), (4, 8), (6, 10)

(d) Gradient = 1

PB 14.3, Q8 (a)

(b) $y = 3x + 1$

Gradient = 3

$y = 4x - 5$

Gradient = 4

P: In the last lesson and in the homework we dealt with lines with equations (writes on BB):

$y = \square \times x + \square$

Their graphs are straight lines not passing through the origin, and the multiplier of $x$ in their equations gives their gradient.

T: This is the same for a straight line passing through the origin. That’s why we can use the letter $m$ again to represent the gradient.

**Activity 1B**

**Mental work**

T: Fine. Look at the following equations and give their gradients.

PB 14.3, Q9

T: $y = 2x + 4$  

Ps: the gradient $m = 2$

$y = 3x - 9$  

$m = 3$

$y = 10x + 1$  

$m = 10$

$y = 5x + 3$  

$m = 5$

T: But what is the other number? We’ll find out soon.

8 mins

**Activity 2A**

**Plotting points and comparing graphs**

T: Plot the following two sets of points on the same grid, draw 1-1 line through both sets and compare them. Also write down their rules.

Set A: $(-2, -4), (0, 0), (2, 4), (4, 8)$

Set B: $(0, 1), (1, 3), (2, 5), (4, 9)$

© CIMT, University of Exeter
**2A (continued)**

### Properties

<table>
<thead>
<tr>
<th></th>
<th>Set A</th>
<th></th>
<th>Set B</th>
</tr>
</thead>
<tbody>
<tr>
<td>Equation</td>
<td>( y = 2x )</td>
<td>Equation</td>
<td>( y = 2x + 1 )</td>
</tr>
<tr>
<td>Line</td>
<td>straight line</td>
<td>Line</td>
<td>straight line</td>
</tr>
<tr>
<td>Origin</td>
<td>passing through the origin</td>
<td>Origin</td>
<td>not passing through the origin</td>
</tr>
<tr>
<td><strong>( m )</strong></td>
<td>2</td>
<td><strong>( m )</strong></td>
<td>2</td>
</tr>
</tbody>
</table>

### Introducing 'the intercept'

T: Look at the two graphs. What happens because the two gradients are the same?

Ps: The graphs are parallel.

T: What is the only difference between the two graphs?

P: The graph of \( y = 2x \) passes through the origin while the graph of \( y = 2x + 1 \) does not.

T: The graph of \( y = 2x + 1 \) doesn't pass through the origin, so what point does it pass through? Look at the two graphs and read the y-coordinates of both of them at the x positions I give you.

<table>
<thead>
<tr>
<th>T:</th>
<th>x = -2</th>
<th>( y ) = -4</th>
<th>( y ) = -3</th>
</tr>
</thead>
<tbody>
<tr>
<td>x = -1</td>
<td>y = -2</td>
<td>( y ) = -1</td>
<td></td>
</tr>
<tr>
<td>x = 0</td>
<td>y = 0</td>
<td>( y ) = 1</td>
<td></td>
</tr>
<tr>
<td>x = 1</td>
<td>y = 2</td>
<td>( y ) = 3</td>
<td></td>
</tr>
<tr>
<td>x = 2</td>
<td>y = 4</td>
<td>( y ) = 5</td>
<td></td>
</tr>
</tbody>
</table>

T: What do you notice?

P: The points of the graph of \( y = 2x + 1 \), at each x position, are higher by 1 (unit) than the points of the graph of \( y = 2x \).

T: The graph of \( y = 2x \) passes through the origin. What does that tell us?

P: The value of \( y = 2x \) is 0 at 0.

T: And ... ?

P: And, at \( y = 2x + 1 \), that is higher by 1. The value is 1 at 0.

T: We can say that \( y = 2x \), passing through the origin, crosses the \( x \)-axis at 0. So ... ?

P: \( y = 2x + 1 \) crosses the \( y \)-axis at 1.

### 2B Introducing 'the intercept'

T: Let's add a fourth row to the table.

<table>
<thead>
<tr>
<th>x</th>
<th>-2</th>
<th>-1</th>
<th>0</th>
<th>1</th>
<th>2</th>
</tr>
</thead>
<tbody>
<tr>
<td>( y = 2x )</td>
<td>-4</td>
<td>-2</td>
<td>0</td>
<td>2</td>
<td>4</td>
</tr>
<tr>
<td>( y = 2x + 1 )</td>
<td>-3</td>
<td>-1</td>
<td>1</td>
<td>3</td>
<td>5</td>
</tr>
<tr>
<td>( y = 2x + 4 )</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

T: Use the rule of \( y = 2x + 4 \) and find its values at -2, -1, ...

T: -2  
Ps: \( 2 \times (-2) + 4 = -4 + 4 = 0 \)  
... etc.

T: What do you notice?
### Activity 2C (continued)

P₃: The values of \( y = 2x + 4 \) are higher by 4 (units) than the values of \( y = 2x \).

T: And at \( x = 0 \) ?

P₄: \( y = 4 \) ... The \( y = 2x + 4 \) crosses the y-axis at 4.

T: What can you state about the other 'something' in the equation of a straight line?

P₅: It shows where the line crosses the y-axis.

T: How could you draw this line without knowing any of its points? Where would you start the line?

P₆: Since it crosses the y-axis at 4, we can start from there, then, because of its gradient, the line rises 2 (units) as we draw it from left to right, step by step.

T: Who would like to draw the line of \( y = 2x - 1 \) on BB?

### 2D General formula of a straight line

P₇ (at BB, describing while drawing on BB):

This graph is lower by 1 than the graph of \( y = 2x \), so it crosses the y-axis at −1. We can start from this point. The next point will be one step from left to right with a rise of 2.

T: Let's check and see if this is correct.

T: Now we can summarise what we know about a line with equation \( y = mx + c \):

Ps: - its graph is a straight line
- its gradient is \( m \), which gives the steepness of the line
- the line crosses the y-axis at \( c \).

T: Good. We're going to call the intercept 'c'.

### Practice - equations of straight lines

OS 14.7 1. (a) gradient line \( A = 2 \), (b) gradient line \( B = -3 \)
2. (a) \( c = 2 \), (b) \( c = 7 \)
3. (a) line \( A : y = 2x + 2 \), line \( B : y = -3x + 7 \)

### Individual practice

PB 14.4, Q1 Solution: (a) graph

(b) \( m = 2 \)
(c) \( c = 3 \)

PB 14.4, Q4 (a)

\( m = 1, \ c = -3, \ y = x - 3 \)
<table>

<td></td>
<td>P₄: ( y = -3x + 2 )</td>
</tr>
</tbody>
</table>

**Notes**

T has asked four Ps to draw grids on BB, each with one of the straight lines of the homework, and to write their equations close to the graphs, as soon as they arrive.

Correction/self-correction.

Feedback. Praising.

Then T points to four Ps (one at a time) from those who failed at homework, asks them to come to BB and explain the solutions, showing that they now understand. T helps them, using the graph and equation.

---

<table>
<thead>
