3  In your exercise book, write each sum as a multiplication, then do the calculation.

- a) \( \frac{1}{2} + \frac{1}{2} + \frac{1}{2} = \frac{1}{2} \times 3 = \frac{3}{2} = 1\frac{1}{2} \)
- b) \( \frac{2}{7} + \frac{2}{7} + \frac{2}{7} + \frac{2}{7} + \frac{2}{7} = \frac{2}{7} \times 5 = \frac{10}{7} = 1\frac{3}{7} \)
- c) \( \frac{3}{8} + \frac{3}{8} + \frac{3}{8} + \frac{3}{8} + \frac{3}{8} \times 6 = \frac{18}{8} = \frac{9}{4} = 2\frac{1}{4} \)
- d) \( -\frac{1}{3} + \left( -\frac{1}{3} \right) = \frac{-2}{3} \)

4  In your exercise book, write each multiplication as an addition, then do the calculation.

- a) \( \frac{3}{4} \times 4 = 3 \)
- b) \( \frac{2}{3} \times 5 = 3\frac{1}{3} \)
- c) \( \frac{4}{7} \times 6 = 3\frac{3}{7} \)

d) \( \frac{5}{8} \times \boxed{2} = \frac{5}{4} \)

e) \( \frac{5}{6} \times 4 = \frac{10}{3} \)

f) \( \frac{5}{3} \times \boxed{6} = 10 \)

Write each calculation in different ways.

\( \left( \frac{3}{2} + \frac{1}{3} \right) \times 12 = \frac{9}{6} + \frac{2}{12} = \frac{11}{6} \times 12 = \frac{132}{6} = 22 \)

or \( \left( \frac{3}{2} + \frac{1}{3} \right) \times 12 = \frac{3}{2} \times 12 + \frac{1}{3} \times 12 = \frac{36}{2} + \frac{12}{3} = 18 + 4 = 22 \)

or \( \frac{3 \times 12}{2} + \frac{1 \times 12}{3} = 18 + 4 = 22 \)

b) \( \left( \frac{4}{5} - \frac{2}{3} \right) \times 4 = \frac{12 - 10}{15} \times 4 = \frac{2}{15} \times 4 = \frac{8}{15} \)

or \( \left( \frac{4}{5} - \frac{2}{3} \right) \times 4 = \frac{4}{5} \times 4 - \frac{2}{3} \times 4 = \frac{16}{5} - \frac{8}{3} \)

A chemist was making up some medicine and measured out 3 different liquids very carefully in these quantities: 28 ml, 2.4 cl and 20.5 cl.

How much liquid did he measure out altogether?

Plan: \(28 \text{ ml} + 24 \text{ ml} + 205 \text{ ml} = 257 \text{ ml} = 25.7 \text{ cl}\)

or \(2.8 \text{ cl} + 2.4 \text{ cl} + 20.5 \text{ cl} = 25.7 \text{ cl}\)

Answer: The chemist measured out 25.7 cl of liquid altogether.

Use the diagram to help you do this addition in different ways.

\(\frac{1}{5} + 0.3 + \frac{17}{100} + \frac{1}{10} + 0.21\)

Calculate using:

a) fractions: \(\frac{1}{5} + \frac{3}{10} + \frac{17}{100} + \frac{1}{10} + \frac{21}{100} = \frac{20 + 30 + 17 + 10 + 21}{100} = \frac{98}{100}\)

b) decimals: \(0.2 + 0.3 + 0.17 + 0.1 + 0.21 = 0.6 + 0.38 = 0.98\)

c) percentages: \(20\% + 30\% + 17\% + 10\% + 21\% = 98\%\)

Which number am I thinking of? Write a plan and do the calculation.

a) Half of the number I am thinking of is 2.3 more than 3.8.
What is my number?
Plan: \( x \div 2 = 3.8 + 2.3 = 6.1 \) or \( (3.8 + 2.3) \times 2 = 12.2 \)
\[ x = 6.1 \times 2 = 12.2 \]
Check: \( \frac{12.2}{2} = (12 + \frac{2}{10}) \div 2 = 6 + \frac{1}{10} = 6.1 \)
\( 6.1 - 2.3 = 3.8 \)

b) If I subtract 10.4 from the number I am thinking of, the difference is 3 times 1.2.
What is my number?
Plan: \( y - 10.4 = 1.2 \times 3 = 3.6 \) or \( 1.2 \times 3 + 10.4 = 14 \)
\[ y = 3.6 + 10.4 = 14 \]
Check: \( 14 - 10.4 = 3.6, \ 3.6 \div 3 = 1.2 \)

b) If I add 4.3 to the number I am thinking of, the sum is 5 times 2.3.
What is my number?
Plan: \( z + 4.3 = 2.3 \times 5 = 11.5 \) or \( 2.3 \times 5 - 4.3 = 7.2 \)
\[ z = 11.5 - 4.3 = 7.2 \]

   Answer: Each part is 0.96 m long.
A group of 6 children weighed themselves and these were the results.

32.5 kg, 31.0 kg, 32.0 kg, 31.0 kg, 30.5 kg, 33 kg

What do they each weigh on average? Calculate the \textbf{mean} value to the nearest 10 g.

\[
\text{Mean} = \frac{32.5 + 31.0 + 32.0 + 31.0 + 30.5 + 33}{6} = \frac{190.0}{6} \\
\approx 31.67 \text{ (kg)}
\]

A group of 5 pupils were asked their ages and these were the results in months.

110 months, 121 months, 113 months, 116 months, 117 months

What is the \textbf{mean} value of their ages?

\[
\text{Mean age: } \frac{110 + 121 + 113 + 116 + 117}{5} = \frac{577}{5} \text{ (months)} \\
\approx 115.4 \text{ months (} \approx 115 \text{ months)}
\]

Calculate the \textbf{mean} age of each family and then compare them.

\textit{The Cabbage family}:

\[
\text{Mean age: } \frac{1 + 2 + 11 + 33 + 35 + 59 + 65}{7} = \frac{206}{7} \\
\approx 29.4 \text{ (years)}
\]

\textit{The Sprout family}:

10 years, 11 years, 16 years, 19 years, 21 years, 42 years, 44 years

\[
\text{Mean age: } \frac{10 + 11 + 16 + 19 + 21 + 42 + 44}{7} = \frac{163}{7} \\
\approx 23.3 \text{ (years)}

When we throw an **unbiased** dice, there are 6 possible outcomes, each equally likely:  
1, 2, 3, 4, 5 or 6

Show the probability of each of these outcomes by joining it to the correct point on the probability scale.

- a) Throwing a 2
- b) Throwing a number less than 3
- c) Throwing a number not less than 3
- d) Throwing a 7
- e) Throwing a number less than 1
- f) Throwing a number greater than 0
- g) Throwing a number greater than 5

Seven children draw lots in the hope of winning a prize. If each child has an equal chance of winning, what is the probability of each of these outcomes happening?

Join the outcomes to the matching points on the probability scale.

- a) C wins.
- b) A or D wins.
- c) G or E or C or A wins.
- d) B and F win.
- e) G does not win.
- f) Neither D not E wins.

The number is:  
- a) 17  
- b) less than 17  
- c) **not** greater than 17  
- d) **not** less than 17  
- e) even  
- f) divisible by 4  
- g) **not** divisible by 4  
- h) either even or odd  
- i) neither even **nor** odd
In a lottery game, 2 numbers are drawn from the numbers 1, 2, 3 and 4.

Let's suppose that each number has an equal chance of being drawn.

a) List the possible outcomes if the order of the two numbers does not matter.
   
   (1, 2), (1, 3), (1, 4), (2, 3), (2, 4), (3, 4) [6 outcomes]

b) What is the probability of these outcomes?
   
   i) The numbers are 1 and 3. \( \frac{1}{6} \)
   
   ii) One of the numbers is 2. \( \frac{1}{2} \)

   iii) One of the numbers is either 1 or 3. \( \frac{5}{6} \)

c) List the possible outcomes if the order of the two numbers does matter.
   
   (1, 2), (1, 3), (1, 4); (2, 1); (2, 3), (2, 4); (3, 1), (3, 2), (3, 4); (4, 1), (4, 2), (4, 3) [12 possible outcomes]

This time the numbers 1, 2, 3 and 4 are written on cards and put into a bag.

A pupil takes out one card with his eyes shut, notes the number and puts it back into the bag again. Then the pupil takes out a 2nd card in the same way and notes the number.

a) List the possible outcomes if the order of the two numbers does not matter.
   
   1, 1 2, 2 3, 3 4, 4
   
   1, 2 2, 3 3, 4
   
   1, 3 2, 4
   
   1, 4 [10 possible outcomes, but not equal probabilities]

b) List the possible outcomes if the order of the two numbers does matter.
   
   1, 1 2, 1 3, 1 4, 1
   
   1, 2 2, 2 3, 2 4, 2
   
   1, 3 2, 3 3, 3 4, 3
   
   1, 4 2, 4 3, 4 4, 4 [16 possible outcomes, with equal probabilities]

Eight children have written their names on a wheel of fortune. The fortune teller spins the wheel to see who is to be chosen to have their fortunes told.

Let's suppose that each letter has an equal chance of coming to rest in front of the arrow and that the wheel cannot stop on the lines between the letters.

What is the probability of each of these outcomes?

a) A wins. \( \frac{1}{8} \)

b) D wins. \( \frac{1}{8} \)

c) B and G win. \( \frac{0}{8} \)

d) F does not win. \( \frac{7}{8} \)

e) C or H wins. \( \frac{1}{4} \)

f) Neither C nor H wins. \( \frac{3}{4} \)

g) The winning name's initial letter comes after C in the alphabet. \( \frac{5}{8} \)

h) The winning name's initial letter comes before C in the alphabet. \( \frac{1}{4} \)

i) E either wins or doesn't win. \( \frac{1}{4} \)
