

<p>Codes and Ciphers</p>	<p>UNIT 14 Morse Code Lesson Plan 1</p>																
<p>Activity</p> <p>1</p>	<p>Historical Introduction</p> <p>(See Teachers Resource Material for historical details. Explain to Ps the method whereby telegraph messages were sent by tapping out the code letters using special machines.)</p> <p>T: Who knows how the code works? <i>(Dots and dashes)</i></p> <p>T: But how? <i>(Each letter has a unique code)</i></p> <p>T: For example ...? <i>(SOS: dot, dot, dot, dash, dash, dash, dot, dot, dot)</i></p> <p>T: Is this the most efficient code to use for the letters SOS? <i>(No)</i></p> <p>T: Why not? <i>(You could use: dot, dash, dot)</i></p> <p>T: Look at your copy of the code: what three letters would 'dot, dash, dot', in fact, give you? <i>(ETE)</i></p> <p>T: So why isn't the most efficient coding used for SOS? <i>(Morse code was devised for all messages, not just for SOS, so the most frequently used letters are coded with the simplest codes)</i></p> <p style="text-align: right;"><i>10 mins</i></p>	<p style="text-align: center;">Notes</p> <p>T: Teacher P: Pupil Ex.B: Exercise Book</p> <p>Interactive discussion using Ps' ideas and knowledge, with T giving information on the historical perspective of Morse code – at the time of its invention it was an enormous breakthrough in communication!</p> <p>T gives out copies of OS 14.3, or shows it on OHP, for Ps to find the letters represented by 'dot, dash, dot'.</p>															
<p>2</p>	<p>Transmission Time</p> <p>T: The time for sending messages needs to be standard for the words to be understood. Units of time are allocated:</p> <table border="1" data-bbox="331 1093 754 1312"> <thead> <tr> <th><i>Character</i></th> <th><i>Time</i></th> </tr> </thead> <tbody> <tr> <td>Dot</td> <td>1 unit of time</td> </tr> <tr> <td>Dash</td> <td>3 units of time</td> </tr> <tr> <td>Letter pause</td> <td>3 units of time</td> </tr> <tr> <td>Word pause</td> <td>7 units of time</td> </tr> </tbody> </table> <p>T: Let's see how long it takes to send SOS. Who can calculate this?</p> <p>P (on OS or board):</p> <table border="1" data-bbox="331 1420 754 1693"> <tbody> <tr> <td>$3 \times 1 + 3 + (3 \times 3) + 3 + 3 \times 1$</td> </tr> <tr> <td style="text-align: center;"> $\uparrow \quad \uparrow \quad \uparrow \quad \uparrow \quad \uparrow$ </td> </tr> <tr> <td style="text-align: center;"> S pause 0 pause S </td> </tr> <tr> <td style="text-align: center;">$= 3 + 3 + 9 + 3 + 3$</td> </tr> <tr> <td style="text-align: center;">$= 21 \text{ units of time}$</td> </tr> </tbody> </table> <p>T: Well done.</p> <p>T: What does the actual time taken to transmit the letters depend on? <i>(The speed of the transmitting operator)</i></p> <p>T: Yes – in fact, experienced operators can average 30 words per minute!</p> <p style="text-align: right;"><i>20 mins</i></p>	<i>Character</i>	<i>Time</i>	Dot	1 unit of time	Dash	3 units of time	Letter pause	3 units of time	Word pause	7 units of time	$3 \times 1 + 3 + (3 \times 3) + 3 + 3 \times 1$	$\uparrow \quad \uparrow \quad \uparrow \quad \uparrow \quad \uparrow$	S pause 0 pause S	$= 3 + 3 + 9 + 3 + 3$	$= 21 \text{ units of time}$	<p>OS 14.1 is shown on OHP; T explains what it means.</p> <p>It would be even better if T could have a Morse code transmitter to actually use in the classroom. (The Science department might be able to provide something similar.)</p> <p>There are also pictures on the various websites on Morse Code; these could be shown to Ps to help their understanding.</p> <p>OS 14.1 Volunteer P writes answer on board, saying aloud what is being done. Other Ps agree/disagree. Discuss errors. T praises.</p> <p>Again, it would be really helpful to have a transmitter, but one P could use a ruler to tap out the message on their tabletop.</p>
<i>Character</i>	<i>Time</i>																
Dot	1 unit of time																
Dash	3 units of time																
Letter pause	3 units of time																
Word pause	7 units of time																
$3 \times 1 + 3 + (3 \times 3) + 3 + 3 \times 1$																	
$\uparrow \quad \uparrow \quad \uparrow \quad \uparrow \quad \uparrow$																	
S pause 0 pause S																	
$= 3 + 3 + 9 + 3 + 3$																	
$= 21 \text{ units of time}$																	

<p>Codes and Ciphers</p>	<p>UNIT 14 Morse Code Lesson Plan 1</p>	
<p>Activity</p> <p>3</p>	<p>Possible Codes</p> <p>T: For Morse code we can use up to four dots or dashes for each letter. What is the quickest code to transmit? <i>(One dot)</i></p> <p>T: Yes – just one unit of time. What else? <i>(One dash)</i></p> <p>T: OK, but how many units of time is this? <i>(3)</i></p> <p>T: Is there a shorter code? <i>(Two dots)</i></p> <p>T: That's right. Two dots take only two units of time to transmit.</p> <p>T: What other codes have just two characters? <i>(dot dash; dash dot; dash dash)</i></p> <p>T: And the length of time for transmitting these ...? <i>(4, 4, 6 units of time)</i></p> <p>T: Now we can use a tree diagram to obtain all the possible codes and their lengths.</p>  <p style="text-align: right;"><i>35 mins</i></p>	<p>Notes</p> <p>This is a good activity for Ps to work on in pairs, after it has been introduced to the whole class.</p> <p>T should put tree diagram on the board and get Ps to complete it. Other Ps watch and help if necessary: agree/disagree.</p> <p>Ps each have a copy of OS 14.2. T gives them 5 minutes to complete the sheet. T monitors and checks progress; then Ps complete the list of codes in transmission-time length order. T gives praise when appropriate. Use OS 14.3 to review.</p>
<p>4</p>	<p>Allocating letters and codes</p> <p>T: How many possible codes are there? <i>(30)</i></p> <p>T: How many do we need? <i>(26)</i></p> <p>T: How do we know which ones to use? <i>(26 with shortest transmission times)</i></p> <p>T: How are they allocated? <i>(According to letter frequency)</i></p> <p>T: OK: here is the usual order of letter frequency for the alphabet. Complete the allocation of letters to codes.</p> <p>T: Here are the actual codes used in Morse code. What do you notice? Complete the table in Appendix 3. <i>(Not all the shortest are used, but there is fairly close agreement)</i></p> <p style="text-align: right;"><i>45 mins</i></p>	<p>Interactive discussion on how best to allocate the codes.</p> <p>T gives out list of letter frequencies (may write on board). Ps each have a copy of Appendix 2 and later Appendix 3 for comparison.</p> <p>Discussion on the similarity between Morse code and the expected codes according to letter frequency.</p>
	<p>Homework</p> <p>Use a mathematical method (e.g. correlation) to compare the two allocations of codes found above.</p>
